DIAGNOSTIC DEVICES

Fujifilm extends its portfolio by introducing disposable cytology brushes and biopsy forceps to collect samples from the respiratory tract, and the removal of foreign bodies in the airway with grasping foreign body forceps.

The cytology brushes range used to obtain tissue cell samples from the airway wall or lesion. Easily passed through the working channel of the bronchoscope. Sterile brush, sterile packed.

The EndoBite² biopsy forceps feature an alligator forceps that provide a larger lung tissue specimen than cup forceps. The oval cup forceps combined with the central spike aim to improve the grip and tissue acquisition.

The unique design of the pelican teeth of the foreign body forceps enhances the gripping ability, making these forceps particularly effective for removing foreign bodies, mucus plugs, and other obstructions.
